

## **CAL 101**

### **Paint Stripper**

CAL 101 - Is a liquid di-phase, non-flammable, cold immersion type of paint-stripper. CAL 101 effectively strips various types of paint from all basic metal. It is one of the few strippers marketed today that removes many epoxy and alkalied types of finishes. CAL 101 does an excellent job on the removal of baked on clear and protective paints and lacquers without staining or discoloring any metals.

Any metal unlined reservoir is a suitable container for CAL 101. It has a chemical seal that keeps the hydro-carbon type solvents from evaporation. It is suggested that addition of water to CAL 101 which will combine with the seal and also help rinse the pieces that are stripped when being removed from CAL 101 solution.

CAL 101 - Is not safe on the skin; but being a chlorinated nature it is non-accumulative as far as absorption of the human body.

CAL 101 - Is entirely safe on all basic and alloy metals.

CAL 101 - Should be followed by a water rinse – solvents will contaminate CAL 101 and should not be injected into the solution.
