

CAL 22

CAL 22 was developed with a single need in mind; **Cal 22** is powdered, water soluble, rust preventative for steel. Simply dip, spray or apply in any desired manner, which the entire part is covered completely and allow to dry, you will receive the rust prevention you desire.

CAL 22 is mixed traditionally with water at a 1% rate to achieve maximum cost efficiency while giving maximum protection. A white powdered residue is a sure sign that too much material has been used. **CAL 22** can be removed easily with any water-based material, for example a soak cleaner or electro cleaner. Please consult with your Cal-Pac representative for further information regarding this and any other Cal-Pac product.
