

CAL STRIP

Description:

CAL STRIP is a highly alkaline powdered compound with a blend of activators and wetting agents combined into a homogeneous de-dusted mixture to give 100% action on stripping and removal of most known paints.

CAL STRIP is a stripper developed to be used on steel. CAL STRIP is a dustless and odorless compound with a pH control. The life of CAL STRIP in solution is maintained for long periods of time and additions to solution are not too frequent to maintain the action. CAL STRIP removes heavily coated surfaces quickly and leaves no white alkaline film on pieces after rinse. It is a long life solution and more effective because CAL STRIP solutions will withstand contamination and still give a stripping job.

Recommended use:

At 8 to 16 oz/gallons of water from 180° through 210° F. The most satisfactory paint removal can be obtained.

Remarks:

Where other alkaline strippers fail, CAL STRIP takes over. This is rated Cal-Pac Chemicals top steel stripper of paints.
