

SPAR CAL

Spray washing compound for ferrous metals

SPAR CAL is a powerful alkaline compound designed especially for heavy duty spray cabinets for use on ferrous metals.

In addition to its strong caustic content SPAR CAL exhibits exceptionally good emulsifying actions in the presence of heavy, greasy soil deposits. Because of its superlative chelating and sequestering action, it has longer tank life than ordinary compounds.

SPAR CAL should be used at concentrations from 4 to 8 oz/gallon of water at a temperature of 180° F. or above.

Caution:

Contains sodium hydroxide. Protect by use of goggles, gloves and aprons. DO NOT inhale or swallow.
